

AMENDMENTS TO THE ABSTRACT:

Please replace the current abstract with the following:

A tool device comprising two sides connected by two axles on which one or several functional tools and two covers are arranged. The tool device is configured to provide a stable T-construction by opening a first cover arranged on a first axle, rotating one of the functional tools arranged on the second axle (such as a thread tap) to 90°, closing the first cover and rotating the second cover 180°. The covers preferably include notches for engaging the functional tool rotated to 90° in a fixed position.
